

APPLICATION RULES

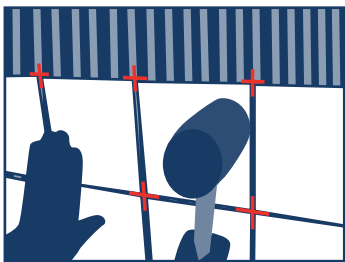

COLOURED GROUT

1. Special care at the beginning of the application of ceramic tiles is reflected on a good-quality grout.

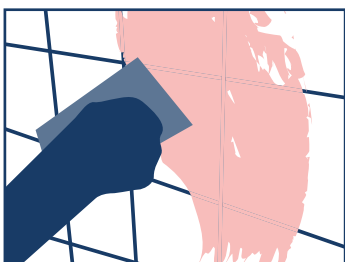

2. The use of tile spacers in the application of ceramic tiles provides a joint with uniform dimensions.

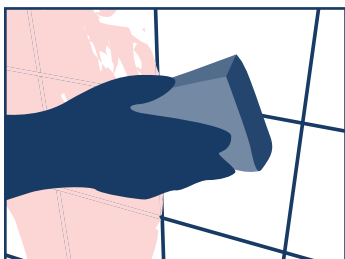

3. For better fixing of ceramic tiles, hammer them gently. Ceramic tiles surface must be clean and the joints must be dry, free from oils, paints and dust. A protector should be applied when the ceramic tile is absorbent or has an uneven surface.

4. Mix the powder with approximately 30% to 34% water. Mix to a consistent slurry. Apply immediately. Do not use water in excess. Never add to the water additive products that we do not recommend.

5. Spread the slurry with a rubber trowel diagonally across the joints, applying some pressure (a mortar sprayer can also be used). Application in small areas is recommended. Do not apply with rain, negative temperatures, direct sunlight and very high temperatures. After application, wait for the hardening, approximately 50 to 100 minutes.

6. Clean with an absorbent sponge. Avoid excess water during cleaning. Excess powder must be dry-cleaned with a cloth.
